Austerity, not influenza, caused the UK’s health to deteriorate. Let’s not make the same mistake again

Prior to the COVID-19 pandemic, England and Wales had seen stalling life expectancy, rising infant mortality rates, increasing mid-aged mortality (including so-called deaths of despair) and tightening restrictions on access to healthcare. Spikes in age-standardised mortality rates were seen, by many, attributed almost unanimously to influenza-like illness (ILI, from Public Health Wales and Royal College of General Practitioners) consultations per 100,000 population in England and Wales from 1993 to 2016. Since 2011, ILI has not exceeded weekly mortality peaks. Notably in 2015–2016, when the biggest year-on-year increase in deaths for almost 50 years was seen, ILI rates were not unusually high.

It is often said that it cannot be proven that austerity has resulted in higher mortality than expected. We disagree. However, what matters now is going into winter 2020, after an incredibly challenging year for the four nations of the UK not only in terms of the pandemic but unemployment, housing precarity, hunger, poverty and the huge impact on mental health, we accept the role austerity has played in the deteriorating health of the nation, and do not repeat the mistakes of the past in blaming ‘influenza’.
